## SUMMARY

AI Solutions Engineer shipping production LLM systems end-to-end — architecture, cost control, and evaluation. Built an LLM lead-generation pipeline (Claude & OpenAI APIs, prompt caching) and a production B2B web platform with self-hosted analytics.

## EXPERIENCE

### WY Industry — AI Solutions Engineer

North Bergen, NJ | Apr 2026 – Present

*Sole technical owner for Soja Foods, a soy-products manufacturer launching in Louisiana — AI, web, analytics, and operations.*

- Built and shipped **sales\_ai**, a two-stage LLM lead-generation pipeline (Next.js, Claude & OpenAI APIs) that discovers B2B buyers, researches each against food-industry criteria, and drafts outreach — cutting per-prospect handling from **~15 min manual to a 2–5 min human review**
- Engineered cost and honesty as first-class constraints: prompt caching, hard search ceilings, per-call billing with monthly budget caps; source-backed research only, no send path — human-in-the-loop by design
- Exposed the pipeline as an **MCP server** (official TypeScript SDK) with per-call cost reporting
- Designed and shipped **sojafood.com** on Cloudflare Pages: D1 database, custom first-party analytics with A/B significance testing, a /wholesale/ B2B funnel, and automated email reporting
- Ran Google Ads experiments (\$742 spend): isolated the only converting keyword, generated 3 qualified wholesale leads, fed learnings back into landing-page copy and targeting

### WGBH (PBS) — Data Science Consultant, BU Spark!

Boston, MA | Sep 2024 – Dec 2024

- Owned the full analytics lifecycle on 20M+ MBTA bus operations records (2018–2024) using Python and SQL
- Found the legacy delay metric understated waiting time; engineered a passenger-centric latency metric adopted as the primary KPI
- Showed routes serving Environmental Justice communities suffered disproportionately long waits (Route 14: 16+ minutes average); findings supported GBH News reporting and policy advocacy

### Tencent — Operations Analyst Intern

Beijing, China | Dec 2023 – Mar 2024

- Codified reproducible topic-keyword patterns into a reusable topic-selection framework, contributing to a cumulative 300K+ increase in video views
- Applied generative AI to content text-cleaning and compliance pre-review SOPs, cutting processing time ~35%

## PROJECTS

- sales\_ai — self-evaluation layer** (Claude & OpenAI): per-call cost instrumentation (**~\$0.06 per prospect**), human-annotated classification accuracy, and funnel cost per stage
- Boston Subway Delay Forecasting** (Azure Data Factory, Spark, SQL): engineered a cloud ETL pipeline joining three live APIs (MBTA, OpenWeather, Ticketmaster), reconciling schemas, timestamps, and rate limits
- Trained an XGBoost regression model (Azure AutoML) on the fused dataset predicting delay duration (**MAE 3.56 min**); ANOVA and t-tests confirmed significant delay effects from major events and adverse weather ( $p < 0.05$ )

## EDUCATION

**Boston University** — M.S., Data Science | Sep 2024 – Jan 2026 · Merit Scholarship

**Syracuse University** — B.S., Business Analytics, CS Minor | Aug 2020 – May 2024 · Magna Cum Laude (GPA 3.7/4.0)

## SKILLS

**AI/LLM:** Claude & OpenAI APIs, MCP, Claude Code, Codex, prompt caching, structured extraction, evals

**Technical:** TypeScript (Next.js, React), Python, SQL, Cloudflare (Pages, D1, Functions), Azure, Git
